 - TP 0.20/0.039 mg/l
 - TN 0.300 mg/l
 - Chla 150 mg/m²
 - Found 25% Threshold Where Compliance with Algae Standard Becomes Tenuous
- DEQ Recommended Critical Exceedance Rate for Compliance with Numeric Nutrient Standards be Set at 20%

DEQ Alternative 2: Back-calculated Water Quality Based Effluent Limits

 Back calculation to determine effluent levels based on instream criteria

$$C_{RP} = \frac{C_E Q_E + C_S Q_S}{Q_E + Q_S} \qquad (eq. \ 1)$$

where:

 C_{RP} = receiving water concentration (RWC) after mixing, mg/L

C_E = effluent concentration, upper bound estimate, Appendix I, mg/l

C_S = RWC upstream of discharge, Appendix IIA, IIIA, mg/L

Qs = receiving water design low flow, 7-day, 10-year low flow (20 or 23 cfs).

O_F = effluent design flow (8.97cfs).

(See Appendix IIB, and IIIB for actual values used in calculations for C_{RP} , C_F , C_S)

EFFLUENT DISCHARGE PERMITTING ISSUES

Appropriate Discharge Permit Structure for Nutrients

- Translation Water Quality Criteria to NPDES to Permit Limits
 - Critical Interpretation of Water Quality Issues
 - Pre-formulated Permit Guidance from EPA and States Often Focused on Toxics

Nutrients Differ From Toxics

Nutrients

- No Immediate Impact
 - Aside from Ammonia
- Watershed Scale Impacts
 - Nutrient Enrichment Leads to Aquatic Growth
- Algal Response Over Longer Periods
 - Longer Averaging Period Appropriate for Nutrients
 - Seasonal or Annual Averages Appropriate
- Treatment Technology
 - Variability at Low Levels in the Best Technologies

Toxics

- Acute and Chronic Impacts on Aquatic Life
 - Chlorine, Metals, Organics
- Near-field (mixing zone) and Farfield (watershed) Impacts
- Long Term Response
 - Average Limits
- Short Term Response
 - Maximum Limits Required
- Treatment Technology
 - Available Technology to Prevent Excursions

Selection of Appropriate Critical Water Quality Conditions for Nutrients

- Default Selection of Extreme Late Summer Conditions and 7Q10 Flows Overly Restrictive
 - -Leads to In-Stream Standards Applied at End-of-Pipe
- Algal Response Over Longer Periods for Nuisance Conditions
 - Longer Averaging Period Appropriate for Nutrients
 - -Seasonal or Annual Average Flows Appropriate
- Watershed Nutrient Loadings v. Effluent Mixing Zone Calculations

Clark Fork River, MT Voluntary Nutrient Reduction Program (VNRP) Selected 30Q10 Flow Condition

NPDES Permitting Regulations

 40 CFR 122.45(d) requires that all permit limits be expressed as average monthly limits and average weekly limits for publicly owned treatment works (POTWs) and as both average monthly limits and maximum daily limits for all others, unless "impracticable."

Maximum monthly, weekly, and daily limits likely to be exceeded by even the best designed and operated low nutrient treatment facilities

Effluent N and P concentration is highly variable for even the best designed and operated low nutrient treatment facilities

Individual permit writers in every nutrient limited watershed must interpret these NPDES regulations and the definition of "impracticable" with limited guidance

Effluent Performance Variability at Low Nutrient Levels in an Exemplary Facility

Daily Maximum, Weekly Average and Monthly Average Limits Not Mandatory

- Guidance from EPA Headquarters Office of Wastewater Management
- Annual Permit Limits for Nitrogen and Phosphorus for Permits Designed to Protect Chesapeake Bay
 - "...permit limits expressed as an annual limit are appropriate and that it is reasonable in this case to conclude that it is "impracticable" to express permit effluent limits as daily maximum, weekly average, or monthly average effluent limitations."

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

WASHINGTON D.C. 20460

MAR 3 2004

OFFICE OF

MEMORANDUM

SUBJECT: Annual Permit Limits for Nitrogen and Phosphorus for Permits

Designed to Protect Chesapeake Bay and its tidal tributaries from Excess Nutrient Loading under the National Pollutant Discharge

Elimination System

ROM: James A. Hanlon, Director

Office of Wastewater Management

TO: Jon Capacasa, Director

Water Permits Division, EPA Region

Rebecca Hanmer, Director Chesapeake Bay Program Office

This memo responds to your proposal to use National Pollutant Discharge Elimination System (NPDES) permit effluent limits for nitrogen and phosphorus expressed as an annual limit in lieu of daily maximum, weekly average, or monthly average effluent limitations, for the protection of Chesapeake Bay and its tidal tributaries from excess nutrient loading. Based on the information provided by your staff and for the reasons and under the circumstances outlined herein, I concur that permit limits expressed as an annual limit are appropriate and that it is reasonable in this case to conclude that it is "impracticable" to express permit effluent limitations as daily maximum, weekly average, or monthly average effluent limitations. This memo describes the scientific and policy rationales that support this approach.

EPA Region 3 has developed recommended water quality criteria for certain parameters designed to protect water quality in Chesapeake Bay and its tidal tributaries.

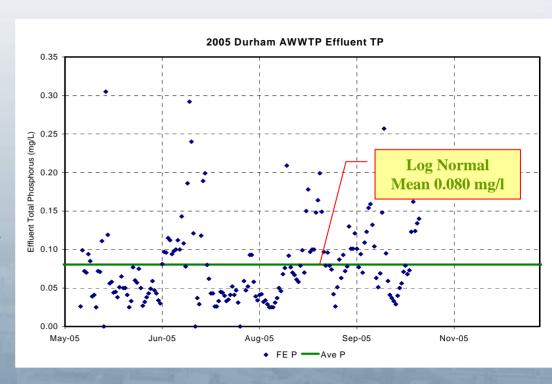

The main cause of water quality impairment for these parameters in the main stem of the Bay is loading of nutrients, specifically nitrogen and phosphorus, from point and nonpoint sources throughout the entire Chesapeake Bay watershed. The States are in the

Internet Address (URL) • http://www.epa.gov
Recycled/Recyclable • Printed with Vegetable Oil Based Inks on Recycled Paper (Minimum 30% Postconsum

See EPA's <u>Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll for the Chesapeake Bay and Its Tidal Tributaries, April 2002.</u> "Chesapeake Bay and its tidal tributaries" is the portion of the Chesapeake Bay waterishe Bay waterishe subject to the ebb and flow of ocean tides. This area encompasses all of the mainstem Bay and the area north and east to the fall line. The fall line is a physical barrier on the Bay's larger tributaries marked by waterfalls and rapids.

Recognition of Daily Treatment Process Variability at Very Low Nutrient Levels

- Daily Process Performance Varies Even in Excellent Treatment Plants
- Compliance Feasible
 - Median or Average Basis
 - Annual or Seasonal
- Maximum Daily or Weekly Limits May Result in Noncompliance

R001	Total Phosphorus	0.10 mg/L

Four individual permits for the operation of publicly owned sewage treatment works (POTWs), one municipal separate storm sewage system (MS4) permit and individual storm water permits for the Durham and Rock Creek Advanced Wastewater Treatment Facilities in the Tualatin River watershed have been integrated and consolidated into this document. This represents a change in the traditional approach to regulatory management of the watershed by integrating several program elements of the Clean Water Act into a single document along with water quality trading. This combination allows 1) greater coordination of watershed protection and enhancement programs, 2) greater coordination of watershed assessment and monitoring activities, and 3) greater public involvement.

Total Phosphorus as P	130 lb/day	174 lb/day	30 lb/day	334 lb/day, Note: This WLA only applies March 1 - October 31; no limit applies the rest of the year.
Total Ammonia as N	379 lb/day	502 lb/day	89 lb/day	970 lb/day, Note: This WLA only applies April 1 - September 30; no limit applies the rest of the year.

- I.A.2. Waste Load Allocation (WLA) The Permittee is authorized to discharge the waste loads listed in Table I.3. for Total Phosphorus as P and Total Ammonia as N, to the Las Vegas Wash. The WLA applies to the combined loading from Outfalls 001 and 002. This permit condition constitutes a cooperative agreement between the City of Las Vegas, Clark County Sanitation District, and City of Henderson (hereinafter dischargers) to allow discharge flexibility. Each facility has an Individual Waste Load Allocation (IWLA) and there is a Sum of Waste Load Allocations (EWLA) defined below for the three facilities. Treatment facilities which are used to attain a waste load allocation are not required to be operated when not needed to meet that allocation.
 - The Permittee shall be considered in compliance if either:
 - i. The Permittee does not exceed the IWLA listed below or the IWLA in effect due to transfers, or
 - The Sum of the Waste Load Allocations (ΣWLA) listed below is not exceeded.

- 0006455

ISSUES FOR NEXT MEETING

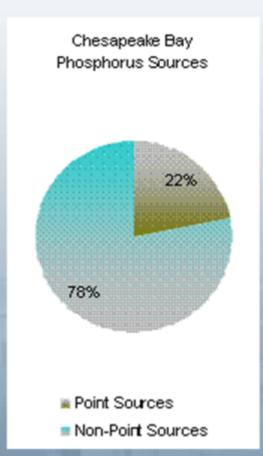

Comparison of Point and Nonpoint Source Nutrient Control Performance

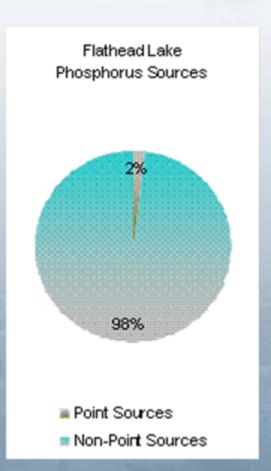

Approach	Nutrient Removal Performance	Cost Effectiveness	
Point Source	80% to 90%	\$0.50 to \$50+ \$/lb	
Advanced Treatment	00 /0 (0 90 /0		
Nonpoint Source		\$0.50 to \$300+ \$/lb	
Best Management Practices ¹	15% to 80%	φυ.ου τυ φουυ* φ/Ιμ	

¹Conservation Tillage, Grass Buffers, Detention Basins, Wetlands

Nonpoint Sources Dominate Many Watersheds

Phosphorus Loading Summaries for Gulf of Mexico, Chesapeake Bay, and Flathead Lake

Sustainability Comparison of Point and Nonpoint Source Nutrient Controls

Approach	Electrical Power	Chemical Use	Greenhouse Gas	Additional Watershed Enhancements
Point Source	+50% to + 250% over Secondary Treatment	Alum, Ferric, Methanol, other carbon sources	+120% over Secondary Treatment	None
Advanced Treatment				
Nonpoint Source		None	Sequesters Carbon	Enhanced Habitat, Aesthetics, Sediment Reduction
Best Management Practices ¹	None			

¹Conservation Tillage, Grass Buffers, Detention Basins, Wetlands

Conditions Required for Potential Water Quality Offsets or Trading

- "Driver" for Pollutant Reductions
 - TMDL
 - NPDFS Permit
 - Permit Limits Conducive to Trading
- Sources with Significantly Different Costs for Control
- Pollutant Reduction Not So Large That All Sources Must Reduce as Much as Possible
 Need a Surplus of Reductions To Trade
- Willing Stakeholders and Agencies
- Loading AnalysisPoint Sources Defined

 - Need to Quantify Nonpoint Source Loadings

Conventional Tillage

Conservation Tillage
